Azco Corp.

Azco Offers Building Blocks of Automation with SmartFrame Technology

Azco Corp.'s building blocks of automation system had been released to bring flexibility for designing a machine configured for specific needs. With the system, modules can be quickly and easily installed or removed, based on the company's requirements.

At the foundation of this system is a SmartFrame which is designed for ease and convenience. It can handle many different modular units. Using the system, modules are easily slid into place and mounted onto the frame. The frame is pre-wired and includes quick-connect connectors for power and air so you can just plug in and begin using. A master control panel monitors the entire process and gives you control over the system, including the ability to add and subtract modules as needed.
