News Article:

Fairfield, NJ - July 30, 2015 – AZCO Corp. offers a custom FG-400 cut-to-length cutting station.

Ten lines of a nonwoven material enter the unit through adjustable infeed guides, which properly space it. From the guides, the material is fed to length by a set of servo driven nip rollers. A module knife assembly cleanly cuts the material to size. After being cut to length, it goes onto a conveyor. 4" lengths of the nonwoven material are fed and cut at a speed of 400 pieces/minute.

Modular in design, the system is easy to use and attaches to the end of an existing process. It can be operated in automatic or manual modes with a dry contact one shot input. The unit only requires 110vac and 60psi compressed air. A color touch screen is used to operate the unit and can be mounted on the frame or relocated by the customer.

We can support these cut-to-length units around the world with our remote access. Each unit is built with a USB port which is directly connected to the controls. The unit can be connected to an internet interface utilizing a USB cable, allowing tech support anywhere in the world. Support for resetting the unit, getting remote training, and even complete software upgrades are available.

AZCO Corp. is an ISO 9001:2008 certified company with over 32 years of experience developing solutions for a wide range of feeding and cutting applications. We offer cutting edge, field proven systems and components that are easily adapted to meet the needs of the most complex applications. AZCO Corp. will provide the most efficient and cost effective solution for you.
