Azco reveals custom system at ICE USA

May 11, 2017

The company used the Building Blocks of Automation concept and a combination of stock components.

Azco's booth at ICE USA

At the recent ICE USA 2017 exhibition in Orlando, FL, USA, Azco revealed a custom system built with its standard dancer unwind, slitter station, roll feeder, knife assembly and rewind modules. Highlighted by a display of colorful LED lighting, visitors to the booth were treated to a clear picture of how a custom solution can be achieved easily and affordably by using a combination of stock components.

Azco designs and manufactures modules and units used to feed, cut and place products. The concept is based on a "Building Block" model. Standard modules and units can be purchased alone or in combination to build a solution that meets the customer's needs. Standard units are in stock and can be customized to fit specific requirements.

Azco units are reliable and simple to use, and include mounting holes for easy installation into any equipment or process. Benefits include no risk, more time and a lower fixed cost. Seamlessly integrating these units into an existing line can increase production speeds and reduce manufacturing costs.

Azco is an ISO 9001:2008 certified company with over 34 years of experience developing solutions for a wide range of feeding and cutting applications.
