AZCO Rotary Crush Cutter Is Modular

July 19, 2013

FAIRFIELD, NJ | AZCO Corp. has designed a **rotary crush cutter** said to be capable of hundreds of cuts per minute. This modular unit can be incorporated into a new machine or replace existing units, and assemblies can be customized to meet specific requirements.

A crush cut is achieved by the blade in the top cylinder cutting against a hardened **anvil roll**. These units have blade spacing from 50 mm/2 in. and up and are good for many types of flexible materials. They are also ideal for **perforated cuts**; perforating blades are available with different patterns. Company says benefits include disposable steel rule die blades, **precision bearings** designed to take high load forces, and a reliable cutting blade assembly designed for quick and easy removal.

The unit has an extended shaft on the cutting cylinder where a timing pulley or gear can be attached. The rotary cutter should always run slightly faster than the web to ensure good cut quality without disturbing the web. Cut length is determined by the relationship of web speed to cutting speed.
